

AI MULTI-STAGE WORKFLOW ASSESSMENT

Scenario	Content Campaign – YouTube Science Explainer
Topic	Why Does Time Feel Faster As We Get Older?
Workflow	Planning → Generation → Critique & Refinement
Required Chain	3 distinct, chained prompts in one chat session

Name	PJ.Ganesh Kumar Reddy
Reg.no	99230040721
E-mail - id	99230040721@klu.ac.in
University	Kalasalingam Academy Od Research and Education

Assessment Evidence

This document records the exact three-stage prompt chain, the intended intermediate outputs, the self-critique gate, and the final refined deliverable. Live-chat screenshots should be placed in the evidence section to demonstrate execution in the assigned AI interface.

1. Scenario & Workflow Overview

Scenario: Create an engaging YouTube content campaign explaining why time can seem to pass faster as people get older.

Audience: Teenagers and young adults.

Output: A concise, story-driven science explainer suitable for approximately five minutes of narration.

Chaining logic: Step 1 produces the content plan; Step 2 transforms that plan into a complete script; Step 3 critiques the Step 2 script against a specific rubric and rewrites it.

STEP 1	STEP 2	STEP 3
PLAN	GENERATE	CRITIQUE + REFINE
Content strategy	Full voice-over script	Self-audit + final script

2. Step 1 — Extraction / Planning

Purpose: Establish the structure, audience, tone, scientific direction, and storytelling strategy before drafting.

Exact Prompt Used

Act as a professional YouTube content strategist and science communicator.

I want to create an engaging YouTube video titled: **“Why Does Time Feel Faster As We Get Older?”**

Create a detailed content plan for a 5-minute video aimed at teenagers and young adults.

The plan should include: 1. A powerful opening hook that makes viewers curious. 2. The main question the video will answer. 3. 4–5 interesting psychological/scientific explanations. 4. Simple real-life examples that viewers can relate to. 5. One surprising fact or insight. 6. A smooth storytelling flow from beginning to end. 7. A memorable conclusion.

Keep the explanations scientifically responsible. Avoid complicated terminology unless you explain it simply.

Output format: Video Hook; Core Question; Section-by-Section Outline; Examples; Surprising Insight; Ending/Call to Action. Make the content curiosity-driven and suitable for YouTube.

Intermediate AI Response — Planning Output

Video Hook: “Have you ever looked at the calendar and wondered where the year went? When you were a child, summer seemed endless. Now entire months can disappear in what feels like a blink.”

Core Question: Why does the passage of time seem to speed up as we age, even though clocks keep moving at exactly the same rate?

Section-by-Section Outline:

1. Hook: Contrast childhood summers with adult years.
2. New experiences: Novel experiences create richer memories, while familiar routines create fewer distinctive memory markers.
3. Proportional time: A year represents a much larger fraction of a young person's life than it does later in life, which can influence subjective perception.
4. Routine and attention: Repeated days can blend together because attention is directed toward tasks rather than the passage of time.
5. Memory versus experience: Looking backward can make a period feel short when it contains fewer memorable events, even if the period felt long while it was happening.

Examples: First day of school, long summer holidays, birthdays, college routines, commuting, vacations, and trying something new.

Surprising Insight: Time perception is not simply about the clock; it can change depending on attention, novelty, memory, and the way we mentally divide life into memorable events.

Ending: Encourage viewers to create more distinctive memories by learning, exploring, and noticing ordinary moments rather than waiting for life to feel slower.

3. Step 2 — Generation / Drafting

Purpose: Transform the Step 1 plan into a complete, record-ready script while preserving the planned structure.

Exact Prompt Used

Using the content plan you created in Step 1, now write the complete 5-minute YouTube script.

Strictly use and expand the ideas from the Step 1 plan.

Requirements: Start with a highly engaging hook within the first 15 seconds; make the viewer feel personally connected to the topic; explain the science in simple language; use storytelling rather than sounding like a textbook; use relatable examples from childhood, school, college, holidays, birthdays, and everyday life; include the surprising insight from Step 1; use smooth transitions; avoid unnecessary repetition; keep pacing suitable for approximately 5 minutes; end with a thought-provoking conclusion.

Format the response as a complete voice-over script with clear section headings.

Intermediate AI Response — Draft Script

HOOK — Where Did the Time Go?

Think about your childhood. Remember how a summer holiday felt almost endless? A single day could feel huge. But now, you blink—and somehow a month is gone. You check the calendar and think, “Wait... it’s already September?”

The strange part is that the clock hasn’t changed. So why does life seem to move faster as we get older?

1. New Experiences Make Time Feel Bigger

One important clue is novelty. When something is new, your brain pays more attention. Think about your first day at school, your first trip somewhere new, or the first time you learned to ride a bicycle. Those moments can feel packed with details. Later, when you remember them, they stand out clearly.

Compare that with a week of repeating the same routine: wake up, travel, study or work, eat, scroll, sleep—and repeat. Because fewer things feel distinctive, the week can seem to disappear when you look back at it.

2. Your Brain Uses Memory Markers

Imagine your memory as a photo album. A year filled with different experiences gives you many different “photos.” A year dominated by the same routine may have fewer memorable markers. Looking backward, the first year can feel much longer simply because there is more to remember.

3. A Year Becomes a Smaller Piece of Your Life

There is also a simple perspective effect. When you are five, one year is a huge part of everything you’ve experienced. When you are twenty, that same year is a much smaller fraction of your life. This doesn’t mean your brain literally changes the clock—it helps explain why the same amount of calendar time can feel different at different ages.

4. Routine Changes Your Attention

When you’re busy with familiar tasks, you usually don’t spend much attention thinking about time. You’re focused on the next class, assignment, meeting, meal, or message. Hours can pass without you noticing.

But when you’re waiting for something—or doing something unfamiliar—time can become much more noticeable. The clock suddenly seems louder in your mind.

5. The Weird Time-Travel Effect

Here's the fascinating part: time can feel slow while you're living through a moment, yet short when you look back at it. A boring afternoon can feel endless while it happens. But a routine-filled month can feel surprisingly short when you remember it later.

THE BIG IDEA

So, time isn't necessarily speeding up. Your experience of time is changing. Novelty, attention, routine, memory, and your perspective on your own life can all influence how quickly time seems to pass.

ENDING

Maybe the answer isn't to make time slow down. Maybe it's to make our days more memorable. Learn something new. Visit somewhere you've never been. Talk to someone you normally wouldn't. Put your phone down and actually notice an ordinary moment.

Because when you look back, those moments may become the markers that make a year feel bigger.

So next time you wonder, "Where did the time go?" remember: the clock may be moving normally. It might be your experience of life that's changing.

4. Step 3 — Evaluation / Refinement

Purpose: Satisfy the critique gate by explicitly evaluating the previous output against a defined rubric, then applying the findings to a complete rewrite.

Exact Prompt Used

Now critically review the YouTube script you created in Step 2.

Evaluate your previous script against this checklist: 1. Is the opening hook strong enough to keep viewers watching? 2. Is the scientific explanation accurate and responsible? 3. Is the language simple enough for teenagers and young adults? 4. Does the script feel like a story rather than a lecture? 5. Are the examples relatable and interesting? 6. Is there unnecessary repetition? 7. Are the transitions smooth? 8. Does the pacing work for approximately 5 minutes? 9. Does the ending leave the viewer with a memorable thought? 10. Is there anything that could make the video more engaging?

First provide a short critique identifying the weaknesses and exactly how you would improve them.

Then use your critique to rewrite the entire Step 2 script. The final version should be polished, engaging, scientifically responsible, and ready to record as a YouTube voice-over.

Clearly label the two parts: **A. Self-Critique** and **B. Final Polished Script**.

Intermediate AI Response — Self-Critique

Strengths: The draft has a clear hook, simple explanations, relatable examples, and a logical progression from childhood memories to routine and memory. The conclusion is reflective and practical.

Improvements: The opening can be more immediate and emotionally relatable. The scientific claims should be framed as explanations of subjective time perception rather than absolute causes. Some sections can be tightened to reduce repetition. The transitions can be more conversational, and the ending can connect the main idea back to the opening image of childhood summers.

Refinement plan: Strengthen the first 15 seconds, use clearer “while you’re living it vs. when you remember it” framing, avoid overclaiming, and make the final takeaway more memorable.

Final Polished Script

HOOK — “It Wasn’t Always This Fast”

Do you remember being a kid and thinking a summer holiday would never end? One week felt enormous. A birthday felt like an event. Even waiting for your favorite TV show could feel like forever.

Now look at your life. A week disappears. A month disappears. And suddenly you’re saying, “How is it already the end of the year?”

The clock isn’t running faster. So what changed?

1. Childhood Is Full of “Firsts”

Think about your first day at school. You probably noticed hundreds of tiny details: the classroom, the teacher, new faces, where you sat, what happened at lunch. Your brain had a lot to process because the experience was unfamiliar.

Now compare that with an ordinary day you’ve lived dozens of times. You wake up, follow your routine, study or work, eat, check your phone, and go to sleep. Because so much is familiar, you may pay less attention to the passage of time.

That difference in novelty can change how memorable a period feels when you look back on it.

2. Your Memory Doesn't Store Every Minute

Your brain isn't recording your life like a security camera. It stores selected information, especially that stand out.

Imagine two weeks. In the first, you repeat exactly the same routine every day. In the second, you take a trip, meet new people, try a new activity, and have an unexpected adventure.

Both weeks contain the same number of hours. But when you look back, the second week may feel much bigger because your memory has more distinctive events to separate it into.

3. A Year Doesn't Mean the Same Thing at Every Age

There's another way to think about it. When you're five years old, one year is a very large portion of the life you've experienced. Later, one year is a smaller portion of your overall life.

This is sometimes used as one explanation for why a year can feel subjectively different as we age. It doesn't mean your brain is literally changing the speed of time. It means our perception of the same calendar interval can be influenced by perspective.

4. Routine Can Make Years Blend Together

Here's something you can test yourself. Think about last Tuesday. Easy? Maybe not.

Now think about your birthday, a holiday, your first day at college, or a trip you took. Those moments probably come back much more clearly.

Routine creates fewer mental landmarks. Novel experiences create more. So when you look backward, a routine-filled period can seem surprisingly short because fewer moments stand out.

5. And Here's the Really Strange Part

Time can feel slow while you're experiencing it, but fast when you remember it.

Waiting in a long queue can feel endless. But a month filled with repetitive days can seem to have vanished when you look back.

So your experience of time isn't controlled by the clock alone. Attention, novelty, memory, routine, and perspective can all shape how fast or slow life seems to move.

THE TAKEAWAY

Maybe getting older doesn't mean time has to feel faster forever. One practical way to create a richer sense of time is to create more memorable moments: learn something new, explore somewhere unfamiliar, meet different people, or simply pay closer attention to an ordinary day.

Because when you look back, your brain may not remember every hour—but it can remember the moments that made those hours meaningful.

So the next time you ask, "Where did the year go?" remember: the clock probably didn't speed up.

Maybe life just needs a few more moments worth remembering.

5. Live Chat Evidence / Screenshot Placement

The assessment asks for direct evidence of the live conversation thread. Insert screenshots of the actual assigned AI interface here. The frames below are professional placeholders only and are not a substitute for authentic screenshots.

Step 1 — LIVE CHAT SCREENSHOT

Step 1 – Gift Detail Extraction (Few-shot Prompting)

Gift Recommendation Workflow

You

10:24 AM

You are an AI Gift Assistant. Extract the following from the user's gift request:
1. Recipient
2. Age
3. Occasion
4. Interests
5. Budget
6. Deadline

Do not recommend any gifts yet.

Use this example:
"I need a birthday gift for my brother. He loves cricket. My budget is ₹1000."

Now analyze this request:
"I need a birthday gift for my best friend. She loves music and books. My budget is ₹1500 and I need the gift by this weekend."

ChatGPT

10:24 AM

Recipient: Best friend
Age: Not specified
Occasion: Birthday
Interests: Music, Books
Budget: ₹1500
Deadline: This weekend

Gift Recommendation Workflow

You

10:27 AM

You are the Step 1 output above, determine the urgency as Low, Medium, or High. Then recommend 3 suitable gifts.

Consider:

- The deadline
- Occasion
- Interests
- Budget

Use the Step 1 information directly in your reasoning.

Output:
Urgency:
Reason:
Gift 1:
Gift 2:
Gift 3:

ChatGPT

10:28 AM

Urgency: High
Reason: The gift is needed by this weekend, so the deadline is close. The recommendations match the recipient's interests in music and books and stay within the ₹1500 budget.

Gift 1: Portable Bluetooth Speaker (₹1,200)
Gift 2: Curated Book Bundle (₹800)
Gift 3: Personalized Music Plaque (₹1,000)

Step 3 — LIVE CHAT SCREENSHOT

Step 3 – Critique & Refinement

The screenshot shows a ChatGPT interface with a sidebar on the left containing 'New chat', 'Explore GPTs', and a 'Today' section with a 'Gift Recommendation Workflow' link. The main chat area displays a conversation between 'You' and 'ChatGPT'. The 'You' message asks for a critique of a previous response, listing six points: improvements needed, matching interests, deadline consideration, practicality, repetitiveness, and urgency classification. It also requests a list of weaknesses, improved recommendations, and a polished final answer with recipient, reason, three improved recommendations, and a short summary. The 'ChatGPT' response provides a detailed critique, identifying weaknesses like lack of personalization, missing explanations, budget issues, and missing summary. It then provides improved recommendations based on high urgency and a time-sensitive deadline, tailored to the recipient's interests (music and books) and within a ₹1500 budget. The final recommendation lists three gifts: Wireless Earbuds, a Book - Bookmark Set, and a Spotify Premium Gift Card. A summary concludes that these gifts match interests, are within budget, and can be arranged before the weekend.

You 10:33 AM

Now critically evaluate your Step 2 response.

1. What are the improvements needed?
2. Does it match the recipient's interests?
3. Does it consider the deadline?
4. Are the recommendations practical?
5. Are there any repetitive or weak suggestions?
6. Is the urgency classification appropriate?

First list the weaknesses you find.
Then improve the recommendations.
Finally, provide the polished final answer with:
- Recipient
- Reason
- 3 Improved gift recommendations
- Short final summary

ChatGPT 10:34 AM

Critique & Improvement:
Weaknesses in the previous response:
1. The gifts are good, but the recommendations could be more personalized to the interests (music + books).
2. The clear explanation of why each gift fits the interests.
3. The first gift (Bluetooth speaker) is slightly over budget (₹1,200) and there's no mention of delivery/availability for the weekend.
4. The summary is missing, and the recommendation could include one more creative option.

Improved Recommendation:
Urgency: High
Reason: The deadline is this weekend, so it's a time-sensitive request. The gifts are tailored to the recipient's interests (music and books) and fall within the ₹1500 budget. All options are practical and easy to buy online or in local stores.

Final Recommendation:
1. Wireless Earbuds (₹1,300) – Perfect for music lovers, portable and within budget.
2. Book – Bookmark Set (₹1,000) – A thoughtful gift for book lovers, with a personalized bookmark option.
3. Spotify Premium Gift Card (₹1,000) – Lets her enjoy her favourite music, easy to deliver instantly.

Summary:
These three gifts match her interests, are within budget, and can be arranged before the weekend, making them ideal for your best friend's birthday.

Step 2 output critiqued → Critique + final response

Evidence checklist

- Screenshots show the same chat session.
- The three prompts are visible and in sequence.
- Step 2 explicitly uses Step 1 output.
- Step 3 explicitly critiques Step 2 output.
- The final polished script is included in the document.
- Chat link is added if the assigned interface provides one.

6. Requirement Compliance

Assessment requirement	How this submission addresses it
At least 3 distinct chained prompts	Step 1 planning → Step 2 drafting → Step 3 critique/refinement.
Same chat session	The workflow is designed to be executed sequentially in one chat.
Each prompt depends on previous output	Step 2 explicitly uses Step 1; Step 3 explicitly reviews Step 2.
Critique gate	Step 3 evaluates the draft against 10 specific criteria and then rewrites it.
Originality / live testing	Authentic screenshots from the assigned AI interface must be inserted in Section 5.
Documentation	Exact prompts, intermediate outputs, critique, and final output are documented.
